FY2015 Trends in Fisheries
FY2016 Fisheries Policy
White Paper on Fisheries: Summary
# Table of Contents

## FY2015 Trends in Fisheries

**Chapter I Special Feature - Development of dynamic fishing communities and fisheries business management**

### Section 1 Significance of fisheries in community development and fishing communities supporting fisheries
- (1) Status of fishing communities .................................................. 1
- (2) Fisheries and fishing communities ............................................. 1
- (3) Roles of far-seas, offshore and coastal fishing in regional economies .... 2
- (4) Fisheries and fishing communities with multiple functions .............. 2

### Section 2 Changes in circumstances surrounding fisheries and fisheries business management
- (1) Changes in circumstances relating to fisheries production .................. 3
- (2) Changes in circumstances relating to fish and fishery product consumption .... 4
- (3) Changes in circumstances surrounding fisheries business management ...... 4

### Section 3 Activation of fishing communities through promotion of fisheries
- (1) Improvement of incomes and enhancement of fisheries business management capabilities to keep up with changing circumstances ...................... 5
- (2) Promotion of fisheries leveraging local resources ............................. 7

### Section 4 Realization of dynamic fishing communities and fisheries business management
- (1) Relocation to fishing communities ............................................... 10
- (2) Empowerment of women with greater roles .................................... 11
- (3) Roles of fisheries cooperatives in activating local communities .......... 11
- (4) Development of safe fishing communities where people can live in peace .... 11
- (5) To pass Japan’s fishing communities on to future generations ............ 11
Chapter II Trends in Japan’s Fisheries since FY2014

Section 1 Trends in fisheries resources and the fishing ground environment .................................................. 12
(1) Significance of resource management ................................................................. 12
(2) Status of the fisheries resources in the waters around Japan ................................ 12
(3) Characteristics of Japan’s fisheries ................................................................. 13
(4) Japan’s fisheries resource management system ............................................. 13
(5) Fishery managers’ voluntary resource management ..................................... 15
(6) Measures to enhance fisheries resources ................................................... 15
(7) Fishing ground environment for enhancing fisheries resources .................. 15
(8) Effects of wildlife and pests on fisheries ................................................... 16
(9) Approaches to practical, effective resource management ............................ 17

Section 2 Trends in Japan’s fisheries ........................................................................ 17
(1) Trends in fisheries and aquaculture ............................................................... 17
(2) Trends in fisheries cooperatives ................................................................. 20
(3) Trends in distribution and processing of fish and fishery products .............. 20

Section 3 Trends in consumption of fish and fishery products along with supply-demand situation .................................................. 22
(1) Supply-demand situation in fish and fishery products .................................. 22
(2) Consumption trends in fish and fishery products ...................................... 22
(3) Export-import trends in fish and fishery products ...................................... 23
(4) Self-sufficiency rates of fish and fishery products .................................... 23

Section 4 International situation surrounding the fishing industry .................... 24
(1) World fisheries and aquaculture ................................................................. 24
(2) The world consumption of fish and fishery products .................................. 25
(3) The world trade of fish and fishery products ............................................. 25
(4) TPP agreement and the government’s response ...................................... 26
(5) WTO’s actions ............................................................................................. 26
(6) Multilateral relations in fisheries ............................................................... 26
(7) Bilateral relations in fisheries .................................................................... 27
(8) International situation surrounding whaling ........................................... 27
(9) International cooperation in fisheries ....................................................... 28

Section 5 Reconstruction from the Great East Japan Earthquake ....................... 28
(1) Reconstruction status of the local fishing industry and fishing communities ... 28
(2) Response to the nuclear power plant accident ........................................... 29

Prize winners at the 2015 Agriculture, Forestry, and Fisheries Festival ............. 31

FY2016 fisheries policy overview ........................................................................ 32

Note: The maps in this document do not necessarily inclusively show Japan’s territory.
(1) Status of fishing communities

(Fishing communities located all along the coastline)

- The Japanese people have been blessed with the bounties of the sea over the past few thousand years.
- Fishing communities have been formed all along Japan’s long, indented coastline at an average interval of 5.6 km.

(Locations of fishing communities)

- About 20% of communities located inland from fishing ports are in isolated island areas and more than 30% in peninsula areas.
- More than 50% of communities located inland from fishing ports are on narrow terrains at the feet of mountains or cliffs and about 25% on steep terrains. They are all vulnerable to disasters such as earthquakes and tsunamis.

* Communities located inland from fishing ports, each with a population of less than 5,000, and more than two fishing households

(Fishing community residents)

- As of 2015, about 2 million people or about 1.6% of Japan’s total population live in communities located inland from fishing ports.
- People aged over 65 constitute 36.3% of the population in those communities, with the percentage exceeding 50% in many, most of them small.
- Thanks to measures such as regional development programs, however, communities with a relatively young population are dotted here and there both in isolated island areas and in peninsula areas; the situation varies from place to place regardless of locations.

(2) Fisheries and fishing communities

(The fishing industry as a regional key industry)

- Fisheries are a key industry supporting regional economies of fishing communities, where employment opportunities are limited. Especially in isolated island areas, more than 70% of the primary industry output comes from fisheries.
- Fisheries and other related industries such as fishing gear, ship equipment, fuel, fish processing, distribution, restaurants and accommodation play a vital role in regional economies all together.
- The fishing industry has a broad reach. It’s a key industry that provides significant employment opportunities and profits to each region.
(3) Roles of far-seas, offshore and coastal fisheries in regional economies

(Far-seas and offshore fisheries catching a massive amount of fish and coastal fisheries catching fish unique to each ocean area)

- A relatively few species of fish (skipjack tuna, tuna, etc.) are caught and frozen in large quantities by far-seas fishing, and primarily pelagic fish, also in large quantities, by offshore fishing. There are many related industries located in and around major ports for far-seas and offshore fishing, which often constitute fisheries cities (though they are limited to specific areas).
- Fishing communities all over the country are engaged in coastal fishing, catching a variety of species ranging from pelagic fish to local fish, which are unique to each region. Their average prices are generally high.
- Coastal fishing does not lead to concentration of related industries, but it provides a variety of fish, playing a vital role in supporting regional economies.

Shares of Far-seas, Offshore and Coastal Fishing in Terms of Volume and Value

<table>
<thead>
<tr>
<th>Fishing Type</th>
<th>Volume Percentage</th>
<th>Value Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offshore</td>
<td>60.8%</td>
<td>31.4%</td>
</tr>
<tr>
<td>Far-seas</td>
<td>9.9%</td>
<td>12.2%</td>
</tr>
<tr>
<td>Coastal</td>
<td>29.4%</td>
<td>56.4%</td>
</tr>
</tbody>
</table>

Source: Volume is derived from the 2014 Fisheries and Aquaculture Production Statistics (compiled by the Ministry of Agriculture, Forestry and Fisheries) and value, from the Fisheries Agency’s Fishing Port Status Overview 2012.

Note: As the production value of marine fishing by section has been excluded from the Fisheries and Aquaculture Production Statistics since 2007, the production value is based exclusively on those landed in the fishing ports specified in the Fishing Port Status Overview (not including those landed in other ports and harbors).

(Coastal fishing, which plays a major role in providing employment to fishing communities)

- 79% of all fishery workers and about 94% of fisheries management bodies are engaged in coastal fishing including aquaculture.
- The smaller the fishing community, the higher the percentage of fishing households.
- Fisheries consisting primarily of coastal fishing play a key role in providing employment to fishing communities that have poor industrial infrastructure.

(4) Fisheries and fishing communities with multiple functions

- Fisheries and fishing communities have multiple functions such as conserving the environment, safeguarding the lives and properties of the public, providing exchange opportunities and developing local communities.
- Part of their value, which can be quantified, is estimated at 9.2 trillion yen a year.
- These multiple functions are only possible with the presence of people engaged in robust fisheries, the benefits from which extend to the public as well as to all fishers.

* Study on the Evaluation of Multiple Functions (issued by the Fisheries Agency in March 2003)
Section 2 Changes in circumstances surrounding fisheries and fisheries business management

(1) Changes in circumstances relating to fisheries production
(Post-war development of fisheries and the turning point)

- Japan’s fisheries developed rapidly in the post-war period, driven by rapid economic growth; powered fishing boats were introduced and fishing grounds expanded from coastal waters to distant waters, which boosted fisheries production.
- In the late 70s and the early 80s, however, social and economic conditions surrounding Japan’s fisheries production changed dramatically - a surge in fish prices, once the growth engine of fisheries, slowed down and the establishment of the 200-nautical mile economic zones forced far-seas fishing fleets to give up fishing grounds and to operate at reduced rates.

Long-term Trends in Average Fish Prices for Far-seas, Offshore and Coastal Fishing

- In the early 80s, the need to manage and utilize fisheries resources in the waters around Japan in a sustainable manner was strongly recognized, leading to full-fledged resource management.
- More and more businesses are working on resource management in recent years, with each fisheries management body participating in several resource management frameworks. In general, fishers are stepping up efforts to manage resources.
- The status of fisheries resources in the waters around Japan has fluctuated significantly over the medium- and long-term, which is particularly true for species such as Japanese sardine. Moreover, rising sea temperatures and changes in their distribution are having an impact on fish distribution and resource levels.

(Long-term Trends in Number of Fishers)

- Japan’s shift to the floating system and the appreciation of the yen against dollar after the Plaza Accord boosted imports of fish and fishery products, which in turn exposes the domestic fishing industry to fierce competition.
- Fluctuations in crude oil and fishmeal prices have had a major impact in recent years on the costs of domestic fisheries production.
- With Japan’s fishing industry increasingly intertwined with the global economy, it should be noted that fisheries business management should take international circumstances into account.

(Aging of fishers and the shortage of successors)

- As fewer young people take over the family businesses at fishing households, coupled with a declining birthrate, the number of young fishers has decreased significantly over the past 50 years up to 2013, which is not necessarily the case with elderly fishers. As a result, the workforce is aging.
- However, in recent years, young fishers are gradually increasing in number, slowing down the aging of the workforce.

Note 1: The “60-69” and “70 and over” brackets are not available before 1983.
Note 2: The data for 2013 includes previously excluded groups (those who lived in non-coastal cities, towns and villages) as it was compiled by fisheries management bodies; it’s not consistent with the data for 2003.
(2) Changes in circumstances relating to fish and fishery product consumption
(Domestic consumption of fish and fishery products per capita and demographic changes)

- In the past, domestic consumption of fish and fishery products per capita surged, driven by rapid economic growth, followed by a gradual increase. However, it peaked in 2001 and decreased rapidly thereafter. The year 2014 saw a per capita consumption of 27.3 kg, which is on par with the levels in the first half of the 1960s.
- A closer look at fish and meat intake by age bracket reveals that younger generations prefer meat to fish; people in their 40s and under consume significantly less fish than those in their 50s and over. Likewise, fish consumption by people of all ages declined in the past 15 years while their meat consumption increased.
- Japan’s decreasing population is another factor leading to less fish consumption.

![Long-term Trends in Annual per Capita Consumption of Fish and Fishery Products](image1)

Source: Food Balance Sheet (prepared by the Ministry of Agriculture, Forestry and Fisheries)

![Changes in Daily per Capita Fish and Meat Intake by Age Bracket](image2)

(Changes in consumption behavior)

- As the real income of the household has declined, the spending on food products shows a downward trend. Price-conscious consumption with focus on economy is increasing.
- Many consumers, meanwhile, have a willingness to increase fish consumption in their diet.
- As consumers’ lifestyles are changing, their needs are diversifying.

(The world's rising consumption of fish and fishery products)

- Globally, health-conscious consumers are increasing, animal protein consumption is on the rise (especially in emerging countries) and seafood distribution systems are improving, boosting consumption of fish and fishery products - a trend that is expected to continue.

(Increasing foreign tourists to Japan)

- The number of foreign tourists to Japan has been on the rise in recent years; they have a strong interest in Japanese food including sushi.
- Fishing communities and their traditional culture are another factor that attracts tourists.

(3) Changes in circumstances surrounding fisheries business management
(Long-term trends in coastal fishing management)

- The income of coastal fishing households has been decreasing gradually since 1994.
- Fuel costs account for about 20% of fishing expenditures while the percentage of depreciation costs has been decreasing over the long term, with investments in facilities becoming sluggish.
The coastal fishing production per fisher has been increasing gradually, resulting in improvements in the productivity per fisher. While individual fishers benefit from improvements in productivity, fisheries as a whole should boost production to ensure a stable supply of fish and fishery products. It’s imperative that the productivity be improved while managing resources properly and securing fishers.

Section 3 Activation of fishing communities through promotion of fisheries

(1) Improvement of incomes and enhancement of fisheries business management capabilities to keep up with changing circumstances
(The need to improve independent management capabilities)

- Fishery managers should proactively improve their management bases and the profitability of their businesses, which is particularly true for the coastal fishing industry with weak foundations.
- Proactive efforts to improve and maintain management capabilities will attract motivated personnel, which leads to further improvements in capabilities, creating a virtuous cycle.

[Case example: Inventive approaches to set net fishing management (Kadoshima Teichi Co., Ltd., Nanao City, Ishikawa Prefecture)]

- Kadoshima Teichi Co., Ltd. takes a variety of inventive approaches to improve the profitability, such as brain destruction to maintain freshness, direct selling and fish processing.
- In addition, the company is creating a lively working environment to secure a workforce and nurture successors while manualizing set net fishing techniques to help employees acquire expertise.
- These approaches are highly valued for their contribution to creating employment and revitalizing the regional economy. They culminated in the winning of the Prime Minister’s Award in 2014 (Hometown Development Grand Prize).
Product development: Development of new products using little-used and unused fish, etc.

Expansion of shipment: Review of sales channels, market integration, etc.

Expansion of consumption: Direct selling, school lunch catering, partnerships with cooperatives, event sponsoring, export promotion, etc.

Examples of income-boosting measures

- Aggressive marketing of new products
- Quality improvement: Immediate killing, brain destruction, standardized post-catch treatment (blood draining, etc.), standardized temperature control (using ice shavings, etc.), quick freezing, improvement and manualizing of processing and aquaculture techniques, standardized meat quality, reduction of transport time through review of operations, etc.
- Hygiene control: Use of sterilized seawater, foolproof measures to prevent food poisoning, etc.
- Boosting catches: Release of fry, extermination of predators, eradication of coarse seaweeds, tillage of the seabed, application of fertilizers (fertilizer blocks), strengthening of resource management, etc.
- Developing new fishing grounds: Aquaculture, set net fishing, introduction of new species for aquaculture, etc.

Examples of cost reduction measures

- Taking energy-saving measures
- Reducing the total weight of fishing boats by reducing the amount of loading
- Reducing the number of fishing boats on the sea, etc.
- Reducing labor cost, fishing gear cost, repair and maintenance costs through partnerships, etc.
- Reducing working time through review of operations, reduction of the number of fishing boats on the sea, etc.

The Seashore Revitalization Plan's Specific Measures

Expanding Production while Managing Resources

- Improving fishing boat maintenance
- Introducing fuel-efficient engines, new fishing gear and processing machines
- Developing new fishing grounds: Aquaculture, set net fishing, introduction of new species for aquaculture, etc.

Expanding the price and added value of fish

- Qualifying improvement: Immediate killing, brain destruction, standardized post-catch treatment (blood draining, etc.), standardized temperature control (using ice shavings, etc.), quick freezing, improvement and manualizing of processing and aquaculture techniques, standardized meat quality, reduction of transport time through review of operations, etc.
- Hygiene control: Use of sterilized seawater, foolproof measures to prevent food poisoning, etc.

Aggressive marketing of new products

- Product development: Development of new products using little-used and unused fish, etc.
- Expansion of shipment: Review of sales channels, market integration, etc.
- Expansion of consumption: Direct selling, school lunch catering, partnerships with cooperatives, event sponsoring, export promotion, etc.

Case example: The regional brand “Goto Princess,” which delivers Goto’s delicacies – The Seashore Revitalization Plan of Kamigoto-cho, Nagasaki Prefecture

- The Seashore Revitalization Plan of Kamigoto-cho, Nagasaki Prefecture, involves an integrated approach, from production to distribution and marketing, designed to expand consumption.
- Complying with uniform standards, certified fishers sell fish and fishery products directly in the market under the “Goto Princess” brand. At the same time, consumer packs are offered to households while the brand is promoted and advertised through participation in events.

Case example: Product development leveraging new technology and region-wide efforts to promote sales - The Seashore Revitalization Plan of Tajima, Hyogo Prefecture

- The Seashore Revitalization Plan of Tajima, Hyogo Prefecture, involves product development leveraging new technology and region-wide efforts to promote sales, all designed to increase fish prices, expand sales channels and promote consumption.
- Efforts are under way to add higher value to snow crabs and firefly squids (both of which are well known nationwide), hold events, conduct direct sales in the market and encourage exchanges between local communities and cities. The aim is to revitalize not only the local fishing industry but also the entire region.

(Cooperative and collaborative efforts to enhance management capabilities)

- For fisheries management bodies, employee shortages are one of the factors undermining their management. Cooperative and collaborative efforts to secure a workforce through streamlining operations can improve the profitability and reduce costs, which in turn is expected to enhance management capabilities.
- Such cooperative and collaborative efforts should be part of fishers’ voluntary efforts.

(Challenges unique to each region and management body)

- To enhance management capabilities, fish catches or prices should be increased to boost incomes while reducing fishing expenditures. Challenges in achieving these, however, are unique to each region and management body.
- While it’s very important to learn from good practices, they should be customized to meet the needs of each region and management body rather than being incorporated as-is.

The Seashore Revitalization Plan to boost incomes

- The Seashore Revitalization Plan aims to boost fishing incomes by at least 10% in five years with voluntary efforts to come up with measures, map out action plans and implement them.
- The government supports the Seashore Revitalization Plan with its fisheries policy measures.
- The Seashore Revitalization Plan varies in its content while it’s imperative that each region and fisher deals with the challenges in a voluntary and independent manner.
Promotion of fisheries leveraging local resources

(Encouragement of corporate participation in fisheries)

- A growing number of companies with sufficient capital are participating in fisheries (such as bluefin tuna farming, which requires significant investment) while becoming members of local fisheries cooperatives through investments in existing fish farmers and establishment of subsidiaries.
- Win-win partnerships between fishers, communities, and companies are key for smooth participation. Mutual trust should be developed between these parties in this regard.

[Case example: Cost reduction through joint operation in far-seas skipjack pole and line fishing]
- Two skipjack fishing boats jointly operate to reduce costs. Measures to improve the management efficiency include pooling of the total value of landings, joint exploration of fishing grounds, sharing of materials, and cooperation in securing a workforce.

(2) Promotion of fisheries leveraging local resources

(Fishing communities’ local resources)

- Fishing communities have various local resources such as fishery products, landscapes, markets, festivals, food culture and leisure spots such as bathing beaches, each of which should be leveraged to activate themselves.
- Specific approaches include promoting sales of fish and fishery products, exchanging with people from other communities, or both. Each community’s location, etc., should be taken into account when leveraging local resources.
- Some local resources remain unnoticed and therefore should be tapped, with their characteristics taken into account.

Examples of Fishing communities’ local resources

<table>
<thead>
<tr>
<th>Category</th>

<tr>
<td>Renewable energy</td>
<td>Wind, wave, solar, biomass, algae, rivers (hydropower), etc.</td>
</tr>
<tr>
<td>Other</td>
<td>Warm seawater baths, salt and seaweed baths, thalassotherapy, deep seawater, etc.</td>
</tr>
</tbody>
</table>

[Case example: The sushi train restaurant Saikaimaru, which leverages its location in the fishing port (The Ishikawa Prefecture Fisheries Cooperative’s Saikai branch)]
- To revitalize the port, the Ishikawa Prefecture Fisheries Cooperative’s Saikai branch and a local set net fishing company jointly opened a sushi train restaurant in the fishing port, an approach that is relatively unusual in Japan.
- The restaurant is visited by many customers from Ishikawa and other prefectures thanks in part to synergies with a direct sales shop.
The production and sales of processed fish products, and the sales of direct sales shops by fisheries management bodies, etc., increased 10% year on year to about 200 billion yen in 2013. They are bolstering their management by branching out into fish processing.

However, fisheries lag behind agriculture in terms of AFFrinnovation partly because of preconceptions that developing processed foods and setting up direct sales shops are not easy.

AFFrinnovation does not necessarily involve new technologies and capital investments; it can be achieved with ingenuity, such as capitalizing on traditional processing techniques.

A full-fledged AFFrinnovation, however, requires reviews and decisions on the business scale, sales channels, financing, etc. It's also important to design a feasible production system, taking into account fish catching operations.

AFFrinnovation by leveraging local resources is an effective way to activate local communities. If it's too challenging, one option for fishers would be to closely cooperate with related industries such as fish processing and distribution.

**Case example: Making hands-on experience in fisheries accessible through collaboration with a hotel (Hibiki Suisan Co., Ltd., Karatsu City, Saga Prefecture)**

Hibiki Suisan, which is engaged in small-scale set net fisheries, collaborates with a hotel run by the local government to offer hands-on experience in set net fishing. The fish caught are served at dinner, which is well received by the participants.

The "hands-on experience" course does not interfere with fisheries operations; it rather contributes to stabilizing the company's management.

**Case example: Dried sardine production leveraging resources unique to an island**

Dried sardine production in Ibuki Island (Kagawa Prefecture) leverages its location in the center of the fishing ground, sourcing freshly caught sardine.

The fisheries cooperative, the local government and tourism businesses are working together to revitalize the region by promoting a food culture based primarily on dried sardine.

There have been growing efforts in recent years to add higher value to catches and promote understanding of fishing operations through hands-on experience. Improvement of added value is achieved when consumers are aware of those efforts and also the needs of consumers are properly reflected in fishing operations.

The fishing industry, therefore, should grow out of "catch-only" fisheries and communicate producers’ efforts to consumers through distribution of products while keeping track of the needs of the market.

The fishing industry, moreover, should closely collaborate with other related industries such as distribution, retail, food-service, tourism and exports to produce results. In fact, many distributors and processors are eager to collaborate with local fishers, and so are related industries.

Source: Research on AFFrinnovation (by the Ministry of Agriculture, Forestry and Fisheries)
[Efforts to expand exports]

○ As the consumption of fish and fishery products is growing worldwide while slowing down in Japan, it's essential that exports be promoted to expand the market.
○ It's therefore important to understand the needs of each overseas market and keep supplying products that meet their requirements.
○ It's also important to develop sales channels in cooperation with distributors, etc. Another effective measure is to promote cooperation among fishers to ensure a stable supply of products.

[Case example: Export promotion through a unified brand originating in Ishinomaki (The Hitakaminokuni Group, Ishinomaki City, Miyagi Prefecture)]

○ Six fisheries processors in Ishinomaki City established the unified brand “Hitakaminokuni” to promote exports of high-value-added products produced from fish caught in the Sanriku region.
○ As they jointly developed processing techniques and packages to meet the needs of overseas buyers, exports to Hong Kong, Taiwan are growing steadily.

(Exchanges with urban residents and foreign tourists)

○ To accommodate urban residents and foreign tourists, quality services (lodging, wining and dining, sightseeing, etc.) should be in place and their safety needs to be ensured.
○ The local fishing industry and other related industries should make concerted efforts to develop systems to accommodate them.

[Case example: Community development by the local specialty mozuku seaweed (The Katsuren Fisheries Cooperative, Okinawa Prefecture)]

○ To boost demand for mozuku seaweed (*Nemacystus decipiens*), the Katsuren Fisheries Cooperative and 12 local bodies including Co-op Okinawa jointly developed a new product based on mozuku dumplings that are on the market.
○ With their roles clearly defined, the product is being distributed through their sales channels. Thanks to collaboration with local traditional arts, moreover, it has become popular in the local market while finding its way into overseas markets. It's also contributing to expanding local production for local consumption, developing local industries and promoting educational/cultural activities.

[Case example: Let's eat Kushima fish (The Kushima Fish Consumption Promotion Group, Kushima City, Miyazaki Prefecture)]

○ The Kushima Fish Consumption Promotion Group, a cross-organizational group, is encouraging consumers in Miyazaki and other cities to eat Kushima fish.
○ These efforts are producing results, gathering views and opinions directly from consumers and promoting partnerships with related industries.

[Case example: Development of a local community through concerted efforts to attract foreign tourists (Kagoshima Prefecture)]

○ Kagoshima Prefecture focuses on attracting tourists from East Asia while cooperation between local industries including fisheries is progressing to meet the diversifying needs of tourists.
○ Attractions unique to Japan and popular among foreign tourists include the “Sushi School,” which offers hands-on experience in making sushi, and the “Makurazaki Soup Stock Class,” where participants enjoy the flavor and taste of dried skipjack soup stock (*dashi*), the very basis of Japanese food.
Section 4 Realization of dynamic fishing communities and fisheries business management

(1) Relocation to fishing communities
(Dynamic fishing communities and those who activate local communities)

- It’s important that local communities be maintained from one generation to the next and their economic activities including fisheries be promoted.
- While some community development efforts are producing results, fishing communities as a whole are aging with the population decreasing. It is therefore essential to encourage relocation to fishing communities and revitalization through creation of a dynamic and livable environment.
- Motivated human resources playing a key role in designing development measures, taking into account the state of affairs, are needed to activate local communities. In addition, those who put the measures into practice should be recruited widely to establish an appropriate system for implementation.

(Growing preference for rural life)

- The poll shows that about 32% of the population, especially young people, want to live in the countryside; about 50% of them think that agricultural, mountain and fishing communities provide a better environment for raising children.
- A growing number of people are relocating to the countryside through U-, I- and J-turns.

### Urban Residents’ Desire to Settle in Countryside

Source: Public Opinion Survey on Agricultural, Mountain and Fishing Communities (released by the Cabinet Office in August 2014)
Note: Based on answers from 1,147 respondents who live in “urban areas” or in “relatively urban areas”

(Acceptance of people relocating to fishing communities in which fisheries play a key role)

- Those who relocate from urban to rural communities need to find jobs and earn enough income to support their lives.
- Fisheries and other related industries are expected to provide employment for those who relocate to fishing communities, which can be beneficial for both parties, given that some communities are faced with workforce shortages.
- There have been many cases where people relocating from other communities provide a spark for concerted efforts to develop local communities.

[Case example: Concerted efforts to support “I-turn” female and male divers (The Ashika Fisher School, Shima City, Mie Prefecture)]

- In the Shijima area (Shima City, Mie Prefecture), where women’s and men’s dive fishing is conducted in summer and gill net fishing in winter, the Ashika Fisher School was established in cooperation with neighboring communities to accept those who want to enter into fisheries. They are guided and trained by skilled fishers on fishing techniques and rules, with support for daily life provided.
- The school also launched fish processing and marketing to help women divers earn steady income and settle into local communities.

(New technologies to reduce fishery labor)

- Various technologies are being developed to improve working conditions and reduce labor in fisheries, which together is expected to encourage participation in fisheries and secure successors.
(2) Empowerment of women with greater roles
- While fisheries have been traditionally considered men’s work, women play a major role in onshore fisheries works.
- The percentage of women in fisheries cooperatives’ regular/board members remains low; they have limited opportunities to participate in key decision-making processes in fishing communities.
- As women are key players in fishing communities, it’s essential that their perspectives as consumers and ordinary citizens be incorporated to activate fisheries and fishing communities. Some of them are starting new businesses while they are expected to play a greater role in their communities.
- Greater support should be provided for women and a change in communities’ consciousness is needed to help them balance work and life. At the same time, they should themselves have a sense of responsibility for the future of their communities.

[Case example: The Oarai-machi Fisheries Cooperative’s Mom’s Shop
(The women’s section of the Oarai-machi Fisheries Cooperative, Ibaraki Prefecture)]
- The women’s section of the Oarai-machi Fisheries Cooperative opened “Mom’s Shop” in 2010, where little-used fish are sold to stabilize fish prices and fishery business management.
- Overcoming damage caused by the Great East Japan Earthquake, the shop is thriving more than ever, and so is the entire port.

(3) Roles of fisheries cooperatives in activating local communities
- Fisheries cooperatives are expected to play a leading role in activating local communities through promotion of fisheries while coordinating local fishers’ interests.

[Case example: The fisheries cooperative’s program to provide hands-on experience in fisheries
(The Kaminokae Fisheries Cooperative, Nakatosha-cho, Kochi Prefecture)]
- The Kaminokae Fisheries Cooperative plays a leading role in a program that provides hands-on experience in fisheries, thereby promoting fisheries and revitalizing the local community; exclusive fishing grounds for the program were set up in consultation with local fishers.
- Facilities for the program, equipped with a kitchen, are also in place along with concerted efforts to promote fisheries and revitalize the local community.

(4) Development of safe fishing communities where people can live in peace
(Improvement of disaster prevention capabilities and promotion of disaster reduction measures)
- While Japan is geographically vulnerable to earthquakes, tsunamis and climate hazards, fishing communities are particularly prone to natural disasters. Infrastructure for prevention and reduction of disasters should thus be improved to ensure the security of life.
- Multiple protection against tsunamis using breakwaters and seawalls is an efficient and effective way to protect life and property. The government constructs breakwaters and seawalls that are resistant to tsunamis, along with evacuation routes to high ground, to improve the disaster prevention capabilities of fishing ports and communities and to promote disaster reduction measures.

(Development of infrastructure to encourage young people to settle in local communities)
- Infrastructure such as sewage should be in place to encourage young people and women to settle in local communities.
- Existing roads should be improved as cars are indispensable for their daily and business life.
- Fishing communities should keep improving their infrastructure and related facilities as they still lag behind towns and villages in terms of living environment.

(Maintenance of infrastructure in the face of declining population)
- Within the next 20 years or so, about half of all port facilities and as many as 70% of coastal protection facilities in Japan will be over 50 years old.
- The Fisheries Agency, therefore, mapped out the Action Plan to Prolong the Life of Our Infrastructure, with efforts under way to shore up the existing infrastructure.
- Effective, efficient maintenance should be implemented to extend the life of existing infrastructure and reduce its lifecycle cost.

(5) To pass Japan’s fishing communities on to future generations
- In order to protect Japanese food culture “Washoku” for future generations, it should be recognized that fishing communities play roles in supplying a variety of seafood through fisheries and that those communities have to be maintained through the generations.
- The public should support each community’s independent and voluntary efforts while the government should support them as needed.
Section 1 Trends in fisheries resources and the fishing ground environment

(1) Significance of resource management

- Fisheries resources - which involve spawning, growing and generation changes in the natural reproductive system - can be sustainable with proper catch management. Put simply, proper resource management is essential for the sustainable use of fisheries resources.

- The UN Convention on the Law of the Sea stipulates that biological resources in EEZs be managed and conserved by respective coastal countries and those in the high seas, by the countries concerned, through their mutual cooperation. Coastal countries including Japan have a major responsibility in resource management.

(2) Status of the fisheries resources in the waters around Japan

- The results of the FY2015 stock assessment (for 84 stocks of 52 species) show that stocks are high in 16 groups (19%), moderate in 26 groups (31%) and low in 42 groups (50%). While the status of each stock changes from year to year, 40-50% of the total has been low and about 20% high, with the rest assessed as moderate in recent years. Fisheries resources, as a whole, vary depending on species and groups, showing no specific trend.

- As for 37 stocks of 16 species that are significant for the lives of people, stocks are high in 10 groups (27%), moderate in 13 groups (35%) and low in 14 groups (38%). About 60-70% of significant species are assessed as moderate or high in terms of stock levels.

- Some of the fisheries resources in the waters around Japan are caught by neighboring counties and regions. The resources, therefore, should be managed, taking into count the impact of their catches, while soliciting their cooperation.

Source: Fish Stock Assessment in the Waters around Japan (Japan Fisheries Research and Education Agency, Fisheries Agency), etc.

Note: The 16 significant species are Pacific saury, Alaska pollock, horse mackerel, Japanese sardine, chub mackerel, southern mackerel, Japanese flying squid, snow crab, Pacific cod, round herring, anchovy, red snow crab, Atka mackerel, Japanese amberjack, red seabream and tiger puffer.
(3) Characteristics of Japan’s fisheries

- The Northwest Pacific, which includes the waters around Japan, is one of the world’s major fishing grounds with extremely high levels of biodiversity.
- There have been fisheries since ancient times in Japan, which is surrounded by the bountiful sea. There are so many fishers and fishing boats operating, most of them small. In the inland waters, a variety of fisheries unique to each area operate.

(4) Japan’s fisheries resource management system

(Fisheries management system for appropriate resource conservation)

- Resource and fisheries management consists primarily of 1) input control, where fishing pressure is controlled at the outset, 2) technical control, which exhibits special management effects such as juvenile fish protection, and 3) output control, where fishing pressure is controlled at the end through setting of TAC (Total Allowable Catch), etc.
- A variety of methods are combined in Japan to properly manage resources, taking into account the characteristics of fisheries, the number of fishermen, status of targeted stocks, etc.

Correlation Between Resource Management Methods

(Fishing rights and the fishing permit system)

- Fishing rights refer to rights for conducting specific types of fishing in permitted waters exclusively within specified periods. They are granted by prefectural governors, covering coastal set net fishing, aquaculture, shellfish fishing, seaweed harvesting and other types of fishing of stationary aquatic animals.
- Far-seas and offshore fishing is subject to permits administered by the Minister of Agriculture, Forestry and Fisheries or prefectural governors.
(TAC system)

- The TAC system, where total allowable catches are set to control catches, has been in place in Japan since 1996. Currently, Pacific saury, Alaska pollack, jack mackerel, Japanese sardine, mackerel (chub mackerel and southern mackerel), Japanese common squid, and snow crab are subject to the system.
- Taking into account a report prepared in 2014 by the ad hoc Task Force on Fisheries Resource Management, the government considers expansion of the TAC system to cover other species that are essential for the lives of people. In particular, Pacific cod is being reviewed for inclusion in the system.

(Resource management based on the IQ system)

- In Japan, TAC allocated to each fishery is further divided by ocean area and period based on fisher’s voluntary agreements, etc., to coordinate operations and maintain stable catches.
- The IQ (Individual Quota) system allocates TAC to individual fishers or boats. The system should be implemented taking into account its effects on each species along with the challenges involved. Southern bluefin tuna, Atlantic bluefin tuna and red snow crab (caught in the Sea of Japan) are currently subject to the IQ system.
- IQ-based fishing trials on mackerel in the Northern Pacific, involving some large- and medium-sized purse seine fishing boats (pursing by one boat), started in October 2014 and were expanded in October 2015 to include all boats, the results of which will be discussed and reviewed.

(Management of Pacific bluefin tuna resources)

- As there is a growing need to tighten the management of Pacific bluefin tuna resources, Japan began to manage them in 2010 according to agreements made at the Western and Central Pacific Fisheries Commission (WCPFC).
- Agreements made at the WCPFC in 2015 involve reduction of the catch of small fish by 50% in 2015 and beyond from the average annual catch between 2002 and 2004. To ensure compliance with this measure, in addition to the management of large- and medium-sized purse seine fisheries, the government asked those engaged in coastal fishing for cooperation. Quotas were set in January 2015 for coastal fishing (troll fishing, set net fishing, etc.) carried out in six blocks nationwide while discussions are under way to enhance the legal basis of the management.

Management of Pacific Bluefin Tuna Catches by Coastal Fishing, etc.

[Total: 2,007 tons] (Coastal fishing, etc.)

*1 Reserved by the Fisheries Agency (19 tons)
*2 Coastal rod fishing (106 tons)

Northern Japan Sea
[596 tons]
Hokkaido, Aomori, Akita, Yamagata, Niigata, Toyama, Ishikawa

Western Japan Sea
[119 tons]
Fuku, Kyoto, Hyogo, Tottori, Shikoku

Northern Pacific
[249 tons]
Hokkaido, Aomori, Iwate, Miyagi, Fukushima, Ibaraki

Western Kyushu
[464 tons]
Yamaguchi, Fukuoka, Saga, Nagasaki, Kumamoto, Kagoshima, Okinawa

Seto Inland Sea
[63 tons]
Wakayama, Osaka, Hyogo, Okayama, Hiroshima, Tokushima, Kagawa, Ehime, Fukuoka, Oita, Yamaguchi

Southern Pacific
[263 tons]
Osaka, Tokyo, Kanagawa, Shizuoka, Aichi, Mie, Wakayama, Tokushima, Kochi, Ehime, Oita, Miyazaki

- The six blocks are based on those of the Sea-area Fisheries Adjustment Commission (excluding Ishikawa, which is included in the northern Japan Sea)

Source: Prepared by the Fisheries Agency

(Management of Japanese eel resources)

- As Japanese eel resource management is an urgent issue, conferences have been held with East Asian countries and a region involved in eel farming to limit the amount of initial input of eel seeds into aquaculture ponds. Accordingly, the government designated eel farming as “designated aquaculture” that requires the permission of the Ministry of Agriculture, Forestry and Fisheries for its operation in June 2015, in accordance with the Inland Water Fishery Promotion Act, to regulate the amount of initial input of eel seeds into aquaculture ponds.
(5) Fishers’ voluntary resource management

- Japan’s resource management consists of statutory regulations and fishers’ voluntary management, which imposes limits on fishing periods, fish lengths, operating time, fishing areas, etc.
- The central and prefectural governments set the Resource Management Guidelines from 2011, based on which the groups of fishers developed and implemented their own resource management plans, putting together voluntary measures in addition to statutory regulations. The resource management and income stability measure is provided for fishers engaged in resource management.

(6) Measures to enhance fisheries resources

- A program is in place to raise fry to juvenile sizes for release, with about 80 species covered.
- The government set the 7th Farming Fisheries Guidelines in March 2015 for the period until 2021 to further promote "resource-creating farming fisheries," where a part of adult fish are conserved for the next generation reproduction.
- Inland water fisheries cooperatives, meanwhile, are working on programs to release sweetfish/eel fries and set up spawning beds, playing a major role in conserving and increasing inland water fisheries resources.
- The Frontier Fishing Ground Enhancement and Development Project is under way to enhance offshore fisheries resources by constructing conservation reefs and breeding grounds.

(7) Fishing ground environment for enhancing fisheries resources

(Impact of climate change on fisheries)

- While it’s difficult to forecast the impact of global warming on marine ecosystems (specifically, the resulting physical changes in the environment), it’s already having an impact on Japan’s fisheries, which need to be closely monitored.
- Adaptation as well as mitigation measures are needed to tackle climate change. The National Plan for Adaptation to the Impacts of Climate Change, which was decided by the cabinet in November 2015, stipulates that impacts on fisheries resources be monitored and aquaculture species resistant to high temperature be developed.
While seaweed beds and tidal flats play a major role in enhancing fisheries resources, they are declining due to coastal development, impact of rising sea temperatures, etc.

The government announced in January 2016 the Seaweed Bed and Tidal Flat Vision, taking into account the results of discussions at the Seaweed Bed and Tidal Flat Vision Workshop; it provides basic approaches to creating and conserving seaweed beds and tidal flats in an effective and efficient way. Prefectural governments are expected to develop and implement their own visions based on the conditions of the waters over which they have jurisdiction.

Main Points of Seaweed Bed and Tidal Flat Vision

Four perspectives in creating and conserving effective, efficient seaweed beds and tidal flats in an effective and efficient way and implementation of conservation measures

1. Determination of the causes of decline
   - The environmental factors such as seaweed bed conditions, water temperatures, tidal currents and sediment conditions are reviewed from a broad perspective to accurately determine the causes of decline.

2. Implementation of broad-based conservation measures, with software and hardware elements combined
   - Taking into account the latest results of research, effective plans are developed, with software and hardware elements combined, to implement conservation measures.
   - Target areas are determined, taking into account the characteristics of seaweed spores/seeds and bivalve larvae, which are transported widely by tidal currents.
   - Conservation measures are prioritized by identifying the areas where spawning adult fish and larval/juvenile fish swarm.
   - The identified areas are monitored continuously to develop a PDCA cycle for adequate implementation of the measures.

3. Proactive introduction of new technologies and findings
   - New technologies developed by the private sector, research institutes, etc., are incorporated along with new findings.

4. Considerations in implementing conservation measures
   - Local governments are expected to play a key role in establishing an implementation system while the central government’s appropriate involvement is needed for measures involving multiple local governments.
   - It’s essential that local fishers, etc., voluntarily and sustainably conserve the concerned seaweed beds and tidal flats after the implementation of the measures.
   - River-deposited sands are considered for use as materials for tidal flat development.
   - Achievements following the implementation of the measures are summarized and communicated to the public to promote understanding of the measures.

Environmental restoration measures should be promoted with focus on the linkage between forests, rivers and seas.

The Guidelines on Promotion of Inland Water Fisheries, which is based on the Act on Promotion of Inland Water Fisheries (instituted in June 2014), provide comprehensive approaches to promoting inland water fisheries, such as restoration of fisheries resources and the fishing ground environment, and the sustainable development of inland water fisheries.

Prefectural governments have mapped out their plans based on the act to restore inland water fisheries resources and the fishing ground environment.

The sato-umi initiative expanding nationwide

"Sato-umi" refers to the waters where natural resources are exploited in a sustainable way, leading to increasing productivity and biodiversity. Accordingly, conservation and restoration programs are gaining momentum nationwide.

With the Act on Special Measures concerning Conservation of the Environment of the Seto Inland Sea revised in October 2015, efforts are under way to create beautiful landscapes, enhance productivity and biodiversity, and develop a bountiful sea (sato-umi) with multiple values and functions while making human activity compatible with nature.

Four perspectives in creating and conserving effective, efficient seaweed beds and tidal flats in an effective and efficient way and implementation of conservation measures

[Column: Floating marine plastic debris]

Floating debris, mostly plastics, is polluting the sea while the amount of plastics dumped into the sea is increasing year by year. The international community should take immediate measures to address this problem.

As most plastics are not decomposable, they cause ghost fishing and affect ship navigation. In addition, they are degraded by UV light, etc., into microplastics containing or adsorbing hazardous chemicals, which are ingested by organisms through food chains. They are likely to have an impact on marine ecosystems.

In some areas, about 70% of floating marine debris is municipal waste that flows into the sea through urban rivers.

G7 Leaders’ Declaration following the Schloss Elmau Summit, which was held in June 2015, addressed for the first time floating marine debris as a global problem.

(8) Effects of wildlife and pests on fisheries

Sea animals such as Steller sea lions are causing damage to fisheries, especially in the waters around Hokkaido. The government, therefore, set the Steller Sea Lion Management Guidelines in August 2014 to expel or drive away Steller sea lions inhabiting the Sea of Japan, allowing to get rid of them in a sustainable way for minimizing damage to fisheries.

Common cormorants are breeding in inland waters while their distribution is expanding. They prey on freshwater fish and their massive amounts of droppings are causing damage to vegetation. The government, therefore, is stepping up measures to get rid of them based on the results of surveys on their habitats and the number of individuals; the objective is to halve their number before 2023 or earlier.
Section 2 Trends in Japan’s fisheries

(1) Trends in fisheries and aquaculture

a) Domestic fisheries and aquaculture production

- The volume of domestic fisheries and aquaculture production leveled off at 4.79 million tons in 2014. Marine fisheries production increased 0.2% (or about 10,000 tons) year on year to 3.74 million tons; mackerel and saury increased while skipjack tuna and Alaska pollack decreased. Marine aquaculture production decreased 1% (or about 10,000 tons) to 990,000 tons; scallop and oyster increased while laver, Japanese amberjack and Wakame seaweed decreased. Inland fisheries and aquaculture production increased 5% (or about 3,000 tons) to 64,000 tons.

- The value of domestic fisheries and aquaculture production increased 5% (or 65.8 billion yen) year on year to 1,505.7 billion yen. Marine fisheries increased 2% (or 21.3 billion yen) to 969.3 billion yen. Marine aquaculture increased 9% (or 37.1 billion yen) to 443.5 billion yen. Inland water fisheries and aquaculture also increased 9% (or 7.3 billion yen) to 92.9 billion yen.
Trends in Production Volume and Value of Japan’s Fisheries and Aquaculture

Source: The Fisheries and Aquaculture Production Statistics (The Ministry of Agriculture, Forestry and Fisheries)
Note 1: The figures of “far-seas fishing,” “offshore fishing” and “coastal fishing” shown above (2007-2010) are all estimates.
Note 3: The catches and production value of inland water fisheries in 2006 and beyond do not include those of recreational fishing.
Note 4: The value of fisheries production is estimated by multiplying the volume of fisheries and aquaculture production by local wholesale prices.
Note 5: Coastal fisheries production by segment in terms of value has not been available since 2007.

b) Trends in fisheries business management

- Fish and fishery product prices vary according to the conditions of catches, which is particularly true for species caught in large quantities. Their average local price stood at 176 yen/kg in 2015.
- The average income of coastal fishing households increased about 100,000 yen year on year to 1.99 million yen in 2014, or 2.15 million yen including non-fishing income.
- Businesses engaged in boat fisheries reported more losses compared to the previous year while non-fishing profits (from fish processing, etc.) have been on the rise, up 25% year on year to 11.75 million yen in 2014.
- Fuel oil prices have fluctuated significantly over the past decade or so while they have been on the decline since July 2014.
- The fishing income of coastal aquaculture households fluctuates significantly, hovering between 3 million yen and over 5 million yen in recent years. It increased 350,000 yen year on year to 5.41 million yen in 2014.
- Imported fish meal prices remain high due to growing consumption by aquaculture (primarily in China) and livestock farming, coupled with a sharp decrease in fish meal production caused by declining anchovy resources in Peru.

Average Local Prices of Fish and Fishery Products

Note 1: The average prices in 2005, 2006, 2007-2009 and 2010-2015 are based on the prices at 203, 197, 42 and 48 ports, respectively.
Note 2: The average price refer to the weighted average price of bluefin tuna (fresh and frozen), albacore (fresh and frozen), bigeye tuna (fresh and frozen), yellowfin tuna (fresh and frozen), skipjack (fresh and frozen), sardine, round herring, anchovy, horse mackerel, round scad, mackerels, saury, Atka mackerel and Japanese common squid (fresh and frozen).
d) Provision of a safe working environment for fisheries

- Fishing boat accidents totaled 600 in 2015 while the reported number of dead and missing decreased by 41 to 24; they accounted for 28% of all marine accidents or 50% of the total number of the dead and missing reported.
- Fishers generally work onboard fishing boats, which in some cases results in accidental falls overboard; 72 fell overboard in 2015 (excluding those related to marine accidents), accounting for about 50% of the total number of those who fell overboard, of which 48 were dead or missing.
- The accident rate in fisheries is about six times higher than the average of all industries.
- A growing number of fishing boats are equipped with digital communication devices for transmission of information in times of emergency.
- As life jackets are vital to saving the lives of those who have fallen overboard, the government selects life jackets that are easy to wear and have little impact on fishery work while encouraging their use through fisheries organizations.

Note: Heavy oil prices (Class A) refer to those at the Keihin District of the National Federation of Fisheries Co-operative Associations, surveyed at the beginning of each month by the Fisheries Agency.

Note 1: Fishers refer to those aged 15 or older who have worked at sea in fisheries for more than 30 days in the past year.
Note 2: Numbers in parentheses refer to the percentages of each age bracket in the total workforce.
Note 3: The data for 2008 and beyond includes previously excluded groups (those who live in non-coastal cities, towns and villages) as it was compiled by employers (i.e., fisheries management bodies); it’s not consistent with the 2003 Census of Fisheries.
Note 4: The data for 2011 and 2012 does not cover Iwate, Miyagi and Fukushima because of the aftermath of the Great East Japan Earthquake.
(2) Trends in fisheries cooperatives

- Fisheries cooperatives play a major role in marketing products, dealing with credit and developing fishing communities. They also manage fishing rights, playing a proactive role in exploiting fish stocks in a sustainable way.
- While both the number of fishers and the production of fisheries have been on the decline, about 70% of the fisheries cooperatives in coastal regions reported losses in 2013. The total sales of all fisheries cooperatives increased by 4.7 billion yen from the previous year, but the loss amounted to 1.6 billion yen.
- As the number of members is decreasing, fisheries cooperatives should promote mergers between them. In 2014, 10 fisheries cooperatives in coastal regions opted for mergers; the number of fisheries cooperatives stood at 966 as of the end of March 2015.

(3) Trends in the distribution and processing of fish and fishery products

- Fresh fish are generally distributed through wholesale markets in landing areas and consuming areas.
- The percentage of distribution costs in retail prices has decreased in recent years while that of price received by producers is on the rise.
- As distribution outside of the wholesale markets is increasing these days, the amount of fish and fishery products distributed through wholesale markets in consuming areas has decreased to 53% of the total.
- The government is promoting the restructuring of wholesale markets to locate them more efficiently. As of the end of 2013, the number of wholesale markets in landing areas was 318, and that of wholesale markets in consuming areas 262, accounting for about 90% and 80%, respectively, of their 2002 levels.
Tokyo’s Tsukiji Market, which opened in 1935, has been serving as the kitchen for Tokyoites while attracting lots of tourists from all over the world. As the market faces various problems (aging facilities, complicated traffic lines in the small premises, the need to improve the hygienic environment, etc.), however, it will be relocated to Toyosu in November 2016. The Toyosu Market, which is larger than the Tsukiji Market, has an advanced system for quality and temperature control, with the wholesale and intermediate wholesale areas are totally enclosed.

The production of processed fishery products has been on a gradual decline in recent years. The shipment value of the fishery processing industry stood at about 3 trillion yen in 2014, accounting for about 12% of the total shipment value of the entire food manufacturing industry. Most fish processing companies are small- to medium-sized enterprises with weak management bases. In particular, the number of small-sized fish processing companies are decreasing. About 60% of edible fish and shellfish distributed in Japan are for processing; the importance of processing is on the rise, driven by the consumers’ needs for easy-to-cook foods and dining out. Decreases in catches and changes in their compositions make it difficult to procure an appropriate amount of right-sized raw materials, which is also the case with imports, as their prices are increasing and demand for fish and fishery products is growing worldwide.

As implementation of hygiene management based on the HACCP principles is imposed on fishery products in the U.S., the EU, etc., fishery processing facilities need to introduce the HACCP principles when exporting fishery products to these countries. The government supports the holding of seminars about prerequisite programs and HACCP principles and renovation of fishery processing facilities for acquiring the HACCP authorization. In order to promote HACCP authorization for exports to the EU, the Fisheries Agency became an authorization body in addition to the Ministry of Health, Labour and Welfare, and started authorization activities in October 2014. The number of authorized facilities is 42 for the EU and 284 for the U.S. as of the end of March 2016.

The Marine Eco-Label Certification System – where eco-labels are attached to products made from fish caught in a sustainable and eco-conscious way – is being adopted gradually, providing consumers with information that helps them select what to buy. Marine Eco-Label Japan (MEL Japan) started providing eco-label certification in 2007 while the Aquaculture Eco-Label (AEL) System has been in place since 2014 for certification of aquaculture practices. As of the end of March 2016, 23 products are certified at the production stage and 53 at the distribution and processing stage, with two aquaculture practices certified by the AEL system. On the overseas front, the Marine Stewardship Council (MSC) and the Aquaculture Stewardship Council (ASC) provide marine eco-label certification. As of the end of March 2016, Japan’s two fishing practices are certified by MSC and 82 distributors and processors have obtained the CoC certification. In addition, oyster culture in the Tokura waters by the Shizugawa Branch of the Miyagi Prefecture Fisheries Cooperative obtained the aquaculture certification from ASC in March 2016 for the first time in Japan, while the CoC certification has been granted to 23 bodies so far.
Section 3 Trends in consumption of fish and fishery products along with supply-demand situation

(1) Supply-demand situation in fish and fishery products

- Supply of fish and fishery products for domestic consumption was estimated at 7.96 million tons for 2014 (converted on a fresh fish basis), of which 6.27 million tons (79%) were for human consumption (food) and 1.69 million (21%) tons for feed and fertilizer (non-food).
- Supply of fish and fishery products for domestic consumption decreased 24% (or 2.56 million tons) from 2004 levels.

Changes in Japan’s Production and Consumption Structure of Fish and Fishery Products

Source: Food Balance Sheet (The Ministry of Agriculture, Forestry and Fisheries)

Note 1: Data (excluding net food-based supply) is converted on a fresh fish basis and does not include whales and seaweeds.

Note 2: The supply of net food per capita per year is based on parts that can be consumed directly (heads, entrails, bones, fins, etc., are excluded).

(2) Consumption trends in fish and fishery products

- Annual consumption of fish and fishery products per capita peaked at 40.2 kg in 2001 and has been on the decline since then; it decreased 0.1 kg year on year to 27.3 kg in 2014.
- Fish are an excellent source of protein and contain a variety of nutrients such as DHA, EPA, etc., which enhance human health. A well-balanced fish diet can maintain and improve health.
- Japanese food and fish diet, which constitute part of Japanese culture, should be promoted through school lunches, etc., to help young people develop their knowledge about food and the ability to select good food.
- Long-term cooperation with various stakeholders is a key to encourage people to eat more fish. A variety of promotion programs are expected to help people savor the taste of fish and expand its consumption.

Source: Food Balance Sheet (The Ministry of Agriculture, Forestry and Fisheries)
(3) Export-import trends in fish and fishery products

- Import volume of fish and fishery products (on a product weight basis) decreased 2% year on year to 2.49 million tons in 2015 while import value increased 4% to 1,716.7 billion yen.
- Major import partners are China, the U.S., Chile and Thailand in terms of value.
- Major import items are shrimp, tunas and billfish, and salmon and trout in terms of value.

(Trends in Import Volume and Value of Fish and Fishery Products)

Source: Trade Statistics (The Ministry of Finance)

(Trends in export volume and value of fish and fishery products from Japan)

- Export volume of fish and fishery products (on a product weight basis) increased 18% year on year to 560,000 tons in 2015 while export value also increased 18% to 275.7 billion yen. Major export partners are Hong Kong, the U.S. and China, which together account for about 60% of the total in terms of value. Major export items are scallops and pearls.
- The Japan Seafood Export Promotion Association was formed in February 2015 to establish “Japan brand” and a year-round supply system through partnerships among producers while receiving support from the government and related organizations such as JETRO.
- To comply with export partners’ health standards, the government promotes HACCP authorization, which is required for exports to the U.S. and the EU, while streamlining the process to issue certificates of export.
- While Washoku is currently booming all around the world, appropriate understanding of Japanese food is important.

(Trends in Export Volume and Value of Fish and Fishery Products)

Source: Trade Statistics (The Ministry of Finance)

(4) Self-sufficiency rates of fish and fishery products

- The self-sufficiency rate of fish and fishery products in 2014 stood at 60%, as it did in the previous year, which can be attributed to a leveling off of domestic production and demand.
Section 4 International situation surrounding the fishing industry

(1) World fisheries and aquaculture
(Production of world fisheries and aquaculture)

- The production of the world fisheries and aquaculture increased 2% year on year to 195.8 million tons in 2014; capture fisheries production increased 1% to 94.66 million tons and aquaculture production increased 4% to 101.14 million tons.
- As for capture fisheries production, herrings, sardines and anchovies stood at 15.22 million tons (16%), leading the pack, followed by cods, hakes and haddocks (8.65 million tons, 9%) and tunas, bonitos and billfishes (7.66 million tons, 8%)
- As for aquaculture production, carps, barbels and other cyprinids stood at 28.23 million tons (28%), followed by red seaweeds (16.55 million tons, 16%) and brown seaweeds (10.21 million tons, 10%)

Source: Food Balance Sheet (The Ministry of Agriculture, Forestry and Fisheries)

Note 1: Self sufficiency rate (%) = (Domestic production volume / Supply for domestic consumption) x 100

Note 2: Supply for domestic consumption = Domestic production + Import – Export – Increase in inventory
(2) The world consumption of fish and fishery products

- The world per capita consumption of fish and fishery products increased from 9.0 kg in 1961 to 18.9 kg in 2011, showing a two-fold increase in recent 50 years.
- Japan’s rank in terms of per capita consumption of fish and fishery products dropped from first to sixth in 2011 among countries with over 1 million people.

(3) The world trade of fish and fishery products

- The world trade of fish and fishery products expanded from 8.13 million tons in 1976 to 35.2 million tons in 2013.
- Salmons, trouts and smelts, shrimps and prawns, and tunas, bonitos and billfishes constitute a large part of the total in terms of value.
- Imports to Japan have been on the decline since 2002 while those to the EU, China and the US are increasing.
Regional fisheries management organizations take necessary conservation and management measures to manage fisheries resources in the high seas and to ensure compliance with the resource management rules. Japan, as a responsible fishing nation, is actively taking part in this initiative. The Convention on the Conservation and Management of High Seas Fisheries Resources in the North Pacific Ocean came into effect in July 2015 to conserve fisheries resources such as Pacific saury, North Pacific armorhead and neon flying squid. While catches of saury by Chinese and Taiwanese fishing boats are increasing, agreements were made on measures to control the number of saury fishing boats operating in the high seas until the introduction of a new conservation and management measure according to stock assessment (scheduled to take place in 2017). The Western and Central Pacific Fisheries Commission (WCPFC) agreed to introduce emergency rules if the recruitment rate decreases significantly and to design their framework in 2016.
(7) International debate on whaling

- The Russian government passed a bill to totally ban drift netting in Russia’s 200-nautical-mile zone, in which Japanese fishing boats can no longer operate drift net fishing to catch salmon and trout. The Japanese government, therefore, is taking comprehensive measures to mitigate impacts on those involved in salmon/trout drift netting, such as fishers and processors.
- The Japanese and South Korean governments agreed in January 2015 to reduce the number of South Korean long line fishing boats operating within Japan’s EEZ by 20% in five years (by the end of 2019), step up efforts to eradicate South Korean illegal fishing boats and approve the operations of the Japanese advanced purse seine fishing boat (199 tons) within South Korea’s EEZ by June 2020.
- The Japanese and Chinese governments agreed in July 2015 to reduce the number of Chinese trawl fishing boats operating within Japan’s EEZ along with their catch quotas, establish a closed season, step up efforts to eradicate Chinese illegal fishing boats operating within temporary zones and reduce the total number of Chinese fishing boats therein. In addition, the two governments verified the effects of the measures agreed upon in December 2014 in eradicating Chinese boats' illegal coral fishing and agreed to continue implementing those measures to prevent recurrence of such incidents.
- Japan and Taiwan agreed in March 2016 to maintain and continue the previous year’s operation rules.
- As Japanese fishing boats’ operations in Pacific island nation’s EEZs are becoming increasingly difficult, the Japanese government works with the countries concerned to maintain fishing operations.

(8) International debate on whaling

- Japan recognizes that whale resources should be used in a sustainable manner as food resources, and a spirit of mutual understanding is required for dietary cultures, which have been historically formed in the respective areas.
- The IWC, which was established to conserve whale resources and develop the whaling industry, remains dysfunctional, unable to make critical decisions.
- The results of Japan’s research show that the Antarctic ecosystem is changing significantly, with Antarctic minke whale resource remaining at a very high level and humpback whale, etc., increasing rapidly.
- Taking into account the judgement of the International Court of Justice in March 2014, Japan embarked on a new research project in December 2015, based on the New Scientific Whale Research Program in the Antarctic Ocean (NEWREP-A).

Outline of New Scientific Whale Research Program in the Antarctic Ocean

</tr>
</thead>
<tbody>
<tr>
<td>Research objectives</td>
<td>(1) Improvements in the precision of biological and ecological information for the application of the Revised Management Procedure (RMP) to the Antarctic minke whale. &lt;br&gt; (2) Investigation of the structure and dynamics of the Antarctic marine ecosystem through building ecosystem models.</td>
</tr>
<tr>
<td>Research area</td>
<td>Latitude: South of 60°S, Longitude: 0° to 120°W (the Management Areas III to VI defined by the International Whaling Commission (IWC))</td>
</tr>
<tr>
<td>Research period</td>
<td>12 years (2015/16–2026/27, mid-term review after the first six years)</td>
</tr>
</tbody>
</table>

Research methods

- (1) Lethal survey <br> a. Whale species: Antarctic minke whale<br> b. Sample size: 333 animals <br> (a) As there is no other means than lethal methods, at this stage, the use of lethal method is indispensable to obtain age data, which is necessary for estimating the age-at-sexual maturity (ASM), which makes considerable contribution to achieving the application of the RMP. <br> (b) The sample size is limited to the number required for estimation of the ASM with sufficient accuracy. <br> (c) Data obtained through lethal sampling will be utilized to the maximum extent to develop improved ecosystem model (Main Objective 2).

- (2) Non-lethal surveys <br> In addition to the non-lethal methods employed by JARPA and JARPA II including sighting surveys for abundance estimation, biopsy sampling of skin tissue and oceanographic observations, the feasibility and practicality of the following non-lethal methods will be examined. <br> (a) Investigating the feasibility of biopsy sampling from Antarctic minke whales, especially in the offshore area in the Antarctic Ocean. <br> (b) Investigating the feasibility of age-determination methods other than ear-plug reading by analyzing DNA extracted from biopsy skin samples. <br> (c) Investigating the feasibility of tracking nutritional status indices by the analysis of retinol and saturated fatty acid extracted from biopsy samples instead of the measurement of body condition such as blubber thickness. <br> (d) Conducting satellite tagging on Antarctic minke whales to elucidate the locations of their breeding grounds, and using data-loggers for research on feeding behavior.

- (3) Krill abundance survey <br> Sample surveys for estimating krill abundance using an echosounder will be conducted.

Research vessels to be used and personnel to be involved

- Implementing organization: Institute of Cetacean Research (ICR) <br> Research vessels: one research base vessel and a few sighting and sampling vessels

Backup plan for contingency

- To minimize any negative influences of disruptions including sabotage activities by an anti-whaling NGO and bad weather conditions and to secure the scientific value of data, this research plan establishes a contingency backup plan including (a) adjustment of research protocols at the scene of disruption, (b) adjustment of the research plan and (c) consideration of alternative analytical methods.

Participation of foreign scientists and collaboration with other researches/organizations

- Participation of foreign scientists will be welcomed and collaboration with other relevant research programs and institutions such as CCAMLR (Commission for the Conservation of Antarctic Marine Living Resources), the National Research Institute of Far Seas Fisheries and the National Institute of Polar Research will be strengthened.
International cooperation in fisheries

In order to ensure fishing grounds and enhance international cooperative relationships, the Japanese government, with JICA as an administrator, offers assistance programs such as fisheries grant aid for promotion of the fishing industry and resource management in developing countries (construction of fisheries facilities, etc.) and technical cooperation (where experts are dispatched or trainees are accepted to develop human resources and their capabilities).

Section 5 Reconstruction from the Great East Japan Earthquake

(1) Reconstruction status of the local fishing industry and fishing communities
(Restoration and reconstruction status of fisheries facilities)

- Of 319 fishing ports in seven prefectures affected, 311 ports were fully or partially operational as of the end of January 2016, though in some cases with limited landing capacities.
- A total of 18,247 fishing boats or 91% of the target (20,000 fishing boats) were either repaired or replaced as of the end of December 2015.
- The harvests of Wakame seaweed, kelp and coho salmon in 2015 fishing season recovered to 76%, 52% and 80%, respectively, of pre-earthquake levels. Oyster culture is also gaining momentum.
- All 34 wholesale fishery markets in landing areas in Iwate, Miyagi and Fukushima were affected by the earthquake. 22 markets in Iwate and Miyagi reopened, while in Fukushima, only one (in Onahama) out of 12 affected resumed operations as of the end of February 2016.
- Of 816 fishery processing facilities in Iwate, Miyagi and Fukushima that have wished to reopen, 86% reopened as of the end of December 2015.
- All debris was removed at 99% of set net fishing grounds and fish farms as of the end of January 2016, with the government supporting removal of the remaining debris.
- The total landings at wholesale fishery markets in the major landing areas in Iwate, Miyagi and Fukushima between February 2015 and January 2016 marked 74% in terms of volume and 93% in terms of value of the level before the earthquake (between March 2010 and February 2011).

### Summary of Restoration/Reconstruction of Fishing Industry from Great East Japan Earthquake (as of March 1, 2016)

- The target is to make landing possible at all the damaged fishing ports (including partial restoration) by the end of FY2015, while reconstructing breakwaters, etc., that were damaged as soon as possible.
- Landing is possible at 311 ports (about 97% of 319 affected ports) as of the end of January 2016 (including landing with limited capacities) Breakdown by prefecture is as follows: Iwate: 96% (104 fishing ports) Miyagi 99% (140 fishing ports) Fukushima 80% (6 fishing ports)
- Damaged piers in Hokkaido, Aomori and Chiba have all been reconstructed.
(2)Response to the nuclear power plant accident

Monitoring of radioactive materials in fishery products in Fukushima and its neighboring prefectures

- The government, in cooperation with the prefectural governments and fisheries cooperatives concerned, promotes monitoring of radioactive materials in fishery products once a week or so.

- The percentage of cases where radioactive materials are detected at levels above the standard limits is decreasing steadily; it’s been less than 1% in Fukushima since the third quarter (July-September) of 2014.

- Distribution suspensions are being relaxed for fish species and areas for which radiation levels are confirmed to be below the standard limits; the number of restricted fish species is steadily decreasing.
As South Korea significantly tightened import restrictions in September 2013, the WTO Dispute Settlement Panel was established in September 2015. Japan will proceed with the Panel procedures while continuing negotiations between the two countries.

(Trial fishing operation off the coast of Fukushima)

- All commercial operations of coastal and trawl fisheries have been voluntarily restricted off the coast of Fukushima.
- Small-scale trial fishing and test marketing of the catches are under way to collect basic data for restarting fishing, with samples evaluated by buyers.
- Fish species and areas of the trial fishing operation have been expanded gradually to 73 species in all waters off Fukushima excluding the area within a 20 km radius from the Fukushima Daiichi Nuclear Power Plant as of March 2016. A total of 943 fishing boats participated in the trials as of the end of March 2016, while the total catch increased to 1,512 tons in 2015.

(Supply of safe fish and fishery products and enhancing provision of information to consumers)

- As some consumers remain suspicious of food produced in Fukushima, the government has continued to monitor radioactive materials in fish and fishery products and to publish the results to consumers in an easy-to-understand manner, in order to address misinformation resulting in unfounded reputational damage and promote consumption based on correct understanding.

(Enhancing provision of information to foreign countries and response to import restrictions)

- Monitoring results are communicated to import partners with explanations on the details of monitoring and safety measures to have import restrictions relaxed or removed. As a result, only eight counties and regions continue to impose bans on fish and fishery product imports from some prefectures.
- As South Korea significantly tightened import restrictions in September 2013, the WTO Dispute Settlement Panel was established in September 2015. Japan will proceed with the Panel procedures while continuing negotiations between the two countries.
Emperor’s Cup Award
Tsushima Kamabokoten Co., Ltd. (Representative: Takahiro Shimai)
(Tsushima City, Nagasaki Prefecture)

Tsushima Kamabokoten established a system to purchase larger-than-standard-size congers at premium prices, thereby stabilizing and improving the market as well as improving the income of fishermen. At the same time, it develops its brand through registering the trademark “Nagasaki-Taishu (Tsushima) -Kogane Conger Eel” and introducing its sashimi (fresh raw meat) grade.

Prime Minister’s Award
The Nagahama fishing settlement (Representative: Hisato Shimono)
(Satsuma Sendai City, Kagoshima Prefecture)

The Nagahama fishing settlement is developing specialty products by adding higher value to previously little-used resources in the region, which has led to the development and commercialization of shrimp furikake (powdered shrimp) and shrimp tsukeage (fried shrimp cake). People of all ages are working in the settlement, providing a good example for the region.

Prime Minister’s Award
The Susa pole and line fishing fleet (Representative: Kiyohisa Ichiki)
(Hagi City, Yamaguchi Prefecture)

The Susa pole and line fishing fleet registered the trademark “Susamikoto Ika” for locally caught kensakiika (white squid) and designed a character and a logo for it for publication in media outlets. In addition, in a project involving local elementary school and junior high school students, the fleet transplanted seaweed and released fry.

Agriculture, Forestry, and Fisheries of Japan Promotion Association
Chairperson’s Award
The Hiroo Fisheries Cooperative Ezobaitsubu Cage Fishing Sub-committee
(Representative: Keishiro Sekishita)
(Hiroo-cho, Hokkaido)

The Hiroo Fisheries Cooperative Ezobaitsubu Cage Fishing Sub-committee has ensured stable management through the conversion to joint management while cooperating with fisheries experimental stations to conserve ezobaitsubu (a species of whelk) resources. It also conducted market research, playing a part in increasing the value of catches.
FY 2016 Fishery policy overview

In accordance with the Basic Plan for Fisheries, which was developed in March 2012, the Japanese government is committed to establish a robust, sustainable fishing industry for the future through conserving and managing fisheries resources, ensuring stable fishery business management through supportive measures, securing and developing human resources in fisheries, and supporting fishers' efforts to help the fishing industry and fishing communities develop multiple functions.

I. Reconstruction from the Great East Japan Earthquake
   1. Steadily implementing measures to realize reconstruction
   2. Overcoming the impact of the accident at TEPCO’s Fukushima Daiichi Nuclear Power Plant

II. Strengthening of fisheries resource management under a new resource management system
   1. Strengthening resource management in Japan’s exclusive economic zones
   2. Promoting global resource management
   3. Enhancing investigative research related to fisheries resources
      ○ Strengthening research on major fish resources in the waters around Japan and improving data collection, thereby enhancing stock assessment systems to manage the resources based on accurate assessments. At the same time, conducting forecasts of fishing ground formation and fishing conditions to improve operating efficiency.

Promotion of research and evaluation of fisheries resources in the waters around Japan

Forecasting fishing grounds formation and fishing conditions

1. Promoting proper resource management with the support and understanding of fishers and the public
   - Improving the accuracy of stock assessment → Gaining the confidence of fishers and the public
   - Improving stock assessment systems
   - Adding species to which TAC control applies
   - Reducing the catches of juvenile fish
   - Shifting to advanced resource management

2. Streamlining fishing operations and reducing their costs
   - Communicating accurate forecasts on fishing ground formation and oceanic conditions
   - Developing operation plans based on the locations of fishing grounds, fish stock and fish sizes

Knowledge and information to improve the accuracy

- Collecting and analyzing information on fishing ground formation, etc., using satellites and electronic devices on fishing boats, etc.
- Understanding resource fluctuation mechanisms such as fluctuations in recruitment due to environmental changes, etc., and in spawning ground formation.

Specific measures

Trends

- 32 -

4. Establishing environmentally friendly, sustainable aquaculture
5. Ensuring the development of fisheries based on the coexistence of a variety of marine organisms

○ While seaweed beds and tidal flats play a vital role in conserving fisheries resources, seaweed beds are declining and tidal flats are becoming less functional due to climate change, etc.

* ABC (Allowable Biological Catch) refers to the catch amount which does not cause a decrease in stock abundance due to the reproduction capacity of the stock.
Taking into account the environmental characteristics of each ocean area, therefore, promoting comprehensive measures with hardware and software elements combined based on the “Seaweed Bed and Tidal Flat Vision,” which provides basic approaches to creating and conserving seaweed beds and tidal flats in an effective and efficient way.

Seaweed Bed and Tidal Flat Vision Overview

IV. Perspectives in creating and conserving seaweed beds and tidal flats in an effective and efficient way and implementation of conservation measures

1. Determination of the causes of decline
   • The environmental factors such as seaweed bed distribution, water temperatures, tidal currents and sediment conditions are reviewed from a broad perspective to accurately determine the causes of decline.

2. Implementation of broad-based conservation measures, with software and hardware elements combined
   • Taking into account the latest results of research, effective plans are developed, with software and hardware elements combined, to implement conservation measures.
   • Target areas are determined, taking into account the characteristics of seaweed spores/seeds and bivalve larvae, which are transported widely by tidal currents.
   • Conservation measures are prioritized by identifying the areas where spawning adult fish and larval/juvenile fish swarm.
   • The identified areas are monitored continuously to develop a PDCA cycle for adequate implementation of the measures.

3. Proactive introduction of new technologies and findings
   • New technologies developed by the private sector, research institutes, etc., are incorporated along with new findings.

4. Considerations in implementing conservation measures
   • Local governments are expected to play a key role in establishing an implementation system while the central government’s appropriate involvement is needed for measures involving multiple local governments.
   • It’s essential that local fishers, etc., voluntarily and sustainably conserve the concerned seaweed beds and tidal flats after the implementation of the measures.
   • River-deposited sands are considered for use as materials for tidal flat development.
   • Achievements following the implementation of the measures are summarized and communicated to the public to promote understanding of the measures.

III. Achieving stability in business management of motivated fishers

1. Stabilizing fisheries business management through supportive measures
   ○ To manage resources properly, stabilize fisheries business management and ensure a stable supply of fish and fishery products, providing the fishery income stabilization measure based on a mutual aid system for fishers and fish farmers who are engaged in resource management plans or aquaculture improvement plans, respectively, combined with the fisheries business management safety net development program for cost reduction purposes.

Overview of fisheries business management stabilization measure

Fishery income stabilization measure

Resource management efforts
- In line with the Resource Management Guidelines prepared by the central and prefectural governments, fishers (organizations) shall develop and implement resource management plans that present voluntary resource management measures such as restrictions on catches and fishing gear.
- Fish farmers shall comply with the farming capacity specified in the aquaculture area improvement plan prepared by a fishery cooperative, etc., to improve and conserve fishing grounds based on the Sustainable Aquaculture Production Assurance Act.

Fishery income stabilization measure
- Resource management efforts are supported through the framework of fisheries mutual-aid insurance and the Tsumitate Plus Program.
  - In the case of income decreasing by a given percentage from the standard income, the loss is compensated for with fisheries mutual-aid insurance (up to 80%) or with the Tsumitate Plus program (up to 90%).
  - Part of the fisheries mutual-aid insurance premium is supported by the government.
  - The support corresponds to the central government’s share of the Tsumitate Plus Program’s deposits (fishery manager 1 : government 3) or 30% (average) of the insurance premium.

Fisheries business management safety net development program
- If oil and feed prices exceed “the average of five out of seven years x 100%,” the excess is compensated for.
- If prices exceed the above-mentioned baselines, the shortfalls are compensated for, with the government share rapped up.
- Additional support is provided in the case of a rapid increase in oil prices.

In addition, promoting new energy-saving and cost-efficient technologies while supporting their demonstration, targeting fisheries and aquaculture.
2. Reviewing fisheries insurance systems

IV. Establishment of a dynamic production system through diversified business management
1. Strengthening the fisheries business management structure to develop internationally competitive fisheries management bodies
2. Developing a high value-added fishing industry
3. Supporting fisheries business management through appropriate loans and credit guarantees
4. Developing and securing human resources in fisheries and promoting women’s participation
   - Developing fisheries management bodies that can sustainably engage in fisheries by securing and developing human resources. To encourage entry into fisheries and foster successors, providing funds to help new entrants prepare themselves for the workplace, offering employment consultation services and supporting long-term OJT training.

V. Strengthening safety measures for fishing boats

VI. Ensuring the stable supply of safe fish and fishery products based on sustainable development of the processing and distribution industries and expanded consumption
1. Enhancing information provision to consumers
2. Promoting the dissemination of a fish-rich diet
3. Promoting quality and hygiene control measures for distribution of fish and fishery products
   - In order to promote HACCP authorization, the government implements measures including on-site guidance to fishery processors, etc., supporting marine monitoring, etc., and development of the Fisheries Agency’s framework for HACCP authorization for exports to the EU.
   - With focus on major fishing ports which serve as hubs of fish and fishery products distribution, streamlining production and distribution systems and setting up facilities for advanced quality/hygiene control to promote consumption and exports.

```
Hygiene control measures at major fishing ports for distribution and exports
```

Challenges and responses
- Expansion of demand through promotion of exports of fish and fishery products
- Declining domestic consumption of fish and fishery products
- Promotion of quality and hygiene control measures at fishing ports for distribution and exports, targeting farmed and cultured fish.

4. Constructing diverse distribution routes
5. Increasing added value based on fishery processing and expanding sales channels
   - The government will promote distribution and expand the consumption of domestic fish and fishery products from upstream (production area) to downstream (consumption area), and meeting consumer needs.
6. Securing processing ingredients for fishery products and ensuring an appropriate supply-and-demand balance

7. Promoting exports of fish and fishery products

8. Securing imports of fish and fishery products

VII. Development of safe and dynamic fishing communities

1. Enhancing measures to prevent and reduce disasters at fishing ports and communities
   - Promoting assessment of fishing port functions, etc., reinforcement of breakwaters and piers while improving their resistance to earthquakes, and enhancing “multiple protection” measures using breakwaters and seawalls, thereby enhancing the capabilities of fishing ports and communities to prevent and reduce disasters.

2. Strengthening and maintaining fishing port functions providing a platform for stable supply of fish and fishery products
   - Promoting strategic measures to extend the lifespan of fishing port facilities in accordance with the Action Plan to Prolong the Life of Our Infrastructure, from the viewpoint of maintaining fishing port functions to ensure a stable supply of fish and fishery products and of making use of fishing ports’ existing infrastructure,
   - Consolidating fishing port functions, such as landing and shipping functions, to improve the distribution structure and reduce the costs of maintenance and replacement of facilities while promoting the use of existing fishing ports as fish farms in quiet waters.

3. Making use of local resources and demonstrating the multiple functions of the fishing industry and fishing communities
   - Activating the fishing industry and fishing communities while revitalizing the fishing industry through support for fishers’ activities in helping the fishing industry and fishing communities demonstrate multiple functions.
   - Supporting the development and implementation of the Seashore Revitalization Plan, where fishers themselves drive innovation to revitalize fishing communities.
Support program for the Seashore Revitalization Plan

VIII. Promotion of technological development and research studies for the development of fishing industry
1. Developing and disseminating new technology for the future of the fishing industry
2. Implementing basic research studies such as marine environment monitoring

IX. Restructuring and improvement of fishery-related organizations
1. Restructuring and improving fisheries cooperatives organizations
2. Securing the business infrastructure of fisheries insurance organizations

X. Other key measures
1. Participating in the Negotiations over the trade of fish and fishery products
2. Compiling and enhancing the use of statistics in line with policy needs

XI. Requirements for the comprehensive and systematic promotion of the fisheries policy
1. Implementing measures based on the experience of the Great East Japan Earthquake
2. Promoting measures efficiently through coordination between relevant ministries and agencies
3. Implementing measures from the public point of view, taking into account the needs of consumers and the public
4. Helping business owners and producers become independent and demonstrate originality and ingenuity
5. Taking fiscal measures in an efficient and focused manner
